THE SATURDAY 60 — Getting Started

Three tools for building a 60-minute indoor cycling class around the music: a BPM selector, a ride build sheet, and a drops library. Free, no account, nothing uploaded anywhere.
There is nothing to download or install from a store. It is a web address that turns into an app.

1 · OPEN IT

https://indoor-cycling.github.io/saturday60/

Open that on your phone or your computer. That is the whole thing — you are already using it.

2 · MAKE IT AN APP (30 SECONDS, OPTIONAL BUT WORTH IT)

Android	Chrome shows an **Install** prompt, or menu ⋮ → **Add to Home screen**. It then opens from your home screen like any other app, with no browser bar.
iPhone / iPad	In Safari, tap **Share** (the square with the arrow) → **Add to Home Screen**.
Computer	Chrome or Edge: the install icon at the right of the address bar, or menu → **Install**. It lands in your Start menu or Applications folder.
Why bother	Installed, it works with **no signal** — in a studio basement, on a plane, anywhere. Nothing is fetched while you use it.

3 · WHAT THE THREE TOOLS DO

Song BPM Selector	Phone-first. Tap in a tempo or type it, see where that song fits and what cadence it beat-locks to, mark the drop times as the track plays, and colour-code them. Send the playlist to the Build Sheet.
MOWL Build Sheet	Desktop-first. The ride block by block: songs, lengths, RPM, positions, drills, power and heart-rate cues. It does the clock maths — you see the class land on 60 minutes as you build it. Prints to a sheet you can ride from.
Drops Library	Every drop time you have ever marked, kept by song. Mark a track once and it fills itself in every week you use that track again.
Also on the hub	**TSS Planner** — scores a class before anyone rides it. **5-Minute FTP Test** and **RPE + Watts cards** — find a rider's FTP and turn it into zones and gear starting points. The Build Sheet's **Export for MOWL** saves a whole class as a MOWL workout file.

4 · THINGS WORTH KNOWING ON DAY ONE

1. **Your data is yours and it is local.** Everything lives in the browser on your own device. There is no account, no server, nothing uploaded, and nobody else can see your rides — including whoever gave you this sheet.
2. **It starts empty.** Your drops library, drills and playlists are your own. Nothing arrives with the app.
3. **Set your own numbers first.** On the Build Sheet, the header line has **FTP** and **Max HR** boxes. Type yours in; the zone table recalculates. Then press **Refresh targets** to rescale the per-song power and heart-rate cues to you.
4. **Back it up now and then.** Each tool has a **Backup** button that writes a dated file, and a **Restore** that reads it. Deleting the installed app can clear its storage on some phones — a backup file is the only copy that survives that.
5. **Phone and desktop are separate.** Same app, but each device keeps its own data. The transfer codes and backup files are how work moves between them.
6. **Updates arrive on their own.** When the app changes, a bar slides up offering **Update now**. Your data is never touched by an update.

Built for Keiser M3 / M3i bikes and the MOWL (Intelligent Cycling) platform, but the tempo, phrase and clock maths apply to any bike. Everything is built around one idea: **PLAYLIST FIRST — MUSIC LEADS.** Pick the songs, then let their structure decide where the efforts go — a drill that starts on a drop feels inevitable; one that starts mid-phrase never does. The full **System Manual** and a one-page **Weekly Workflow** checklist are linked from the app's home screen. `https://indoor-cycling.github.io/saturday60/`
